Let's Start!

Let's talk about information systems!

Learning Outcome:

Understands systems theories, business processes and basic concepts on IT.
Create a map of processes that allows identifying areas in an information system, using IT tools to generate reports based on the company's needs.

Ask your partner:

- Do you think computers influence the way we transfer information?
- How do you think technology can benefit businesses?

Can Do Statements:

- I can talk about the concept of information systems.
- I can list the components of information systems.
- I can talk about the differences between computers and information systems.

Let's Explore!

Oscar explains the concept of information systems.

Instructions: Read the text below.

- Mike:** Okay Oscar, let's start the interview. Can you explain to me the concept of information systems?
- Oscar:** Yes, information systems constitute a group of systems which process, store, and distribute information to improve the management of companies.
- Mike:** Excellent! Now, I want to know. What are the main components of information systems?
- Oscar:** In information systems you find, first, human resources. These are the programmers, the systems analysts, and the users. Second, there is a hardware component, which is the machines and computer systems. There is also a software that controls hardware functionality. Finally, the Internet, Intranet, and Extranet resources that combine with interconnected devices and integrate with telecommunications networks.
- Mike:** Nice, I can't deny your aptitude for this job. Well, do you think developers and users are important in information systems?
- Oscar:** Hmmm, what can I say? You can't ignore the importance of professionals and users because they create and control the software and hardware.
- Mike:** Yes, of course. But you can't ignore the basis such as data which is the source of information in a computer.
- Oscar:** That's right, I can also say that you can't work without any component of software because this affects the functioning of the system.
- Mike:** Good advice. Now, my last question. What kind of differences do you find between computers and information systems?
- Oscar:** Information systems are a mixture of computer science and business. Computers are effective machines for processing information, while information systems use different components (among these the computer) to improve the decision making process of an organization. So, we can't really say that computers are an information system entirely, but an essential part of it, which helps us process data.

Let's Practice!

What is information Systems?

Instructions: Use words from the box below to correctly complete the sentences.

- | | | | | | |
|----|---|----|-----------------------------------|----|-----------------------------------|
| 1. | <input type="text" value="constitution"/> | 2. | <input type="text" value="Has"/> | 3. | <input type="text" value="uses"/> |
| | <input type="text" value="constitute"/> | | <input type="text" value="has"/> | | <input type="text" value="use"/> |
| | <input type="text" value="constitutes"/> | | <input type="text" value="have"/> | | <input type="text" value="Uses"/> |

- Information systems _____ a discipline that integrates computer science and business.
- Information systems _____ an important position as independent scientific studies.
- An information system _____ networks to process information inside a company.

Let's Practice!

You can't forget information systems components.

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: can't operate, can't delete, can't ignore.

- You _____ the importance of the work that people do in informational systems.
- You _____ a system without the right hardware and software components.
- You _____ software from your computer because it integrates telecommunication networks.

Extension Activity

A concept map about information systems and computers.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about information systems and computers.
- Make one concept map with these two topics.
- Write inside the concept map about the importance and function of these concepts.
- Share your concept map with the class and discuss about more information related to these topics.

Self-Assessment

Yes No

- | | | |
|--|-----------------------|-----------------------|
| 1. I find information about information systems and computers. | ☐ | ☐ |
| 2. I organize information systems and computers concepts in concept maps. | ☐ | ☐ |
| 3. I identify important aspects from information systems and computers. | ☐ | ☐ |
| 4. I share my concept map with the class and discuss about more information related to these topics. | ☐ | ☐ |

Target Words

- **deny** (verb): to refuse or disagree with something that is not true
e.g. Nice, I can't deny your aptitude for this job.
- **system analysts** (noun): a professional dedicated to design, analyze and put in practice information systems
e.g. In information systems you find, first, human resources. These are the programmers, the systems analysts, and the users.
- **telecommunications network** (noun): communication between terminals nodes, which use message, packet or circuit switching
e.g. The Internet, Intranet, and Extranet resources that combine with interconnected devices and integrate with telecommunications networks.
- **computer science** (noun): the study of the theory and methods of processing information in digital computers
e.g. Information systems are a mixture of computer science and business.
- **intranet** (noun): a computer network with controlled and limited access
e.g. the Internet, Intranet, and Extranet resources that combine with interconnected devices and integrate with telecommunications networks.

Learning Points

Verb Can for Ability in Negative Statements

You use the modal verb **can** with different purposes, one of them is to express ability.

You use **can** in negative statements to express that someone lacks any general or specific ability. The structure of can in negative statements is very similar to that of affirmative statements.

Subject + **can** + **not** + **main verb in its base form** + complement

For example:

You **cannot work** in information systems.

We can also use the contraction '**can't**' instead of '**cannot**'.

For example:

He **can't** manage a computer software, first you need to study.

He **can't** access to an intranet without authorization.

Examples

- *I can't deny your aptitude for this job. Well, do you think developers and users are important in information systems?*
- *You can't ignore the importance of professionals and users because they create and control the software and hardware.*
- *But you can't ignore the basis such as data which is the source of information in a computer.*

Learning Points

Computers VS Information Systems

In computing there are many concepts that seem similar. Thus, it is important to identify and make an appropriate use of them. People usually think that **computers** and **information systems** (IS) are synonyms, but there is an important difference between the two of them.

Information Systems	Computers
Information systems (IS) is a group of components which process, store and distribute information to enhance the management in companies. An efficient application of IS requires knowledge about the environment and businesses involved. Most information systems integrate information that computer systems can give to support any company or group procedures.	Computers are machines that provide successful ways of processing data, they are a necessary part of an information system. Computers demonstrate the design, operation and maintenance of complex systems as being an essential part of this.
EXAMPLE:	EXAMPLE:
<i>When you use information systems for registering transactions, it is necessary to understand the procedures related to buying and selling stocks.</i>	<i>Computers, like buses, are only one component in a complex system. To understand the transportation systems it is relevant to know about roads conditions, street stops, lanes and users' needs.</i>
